

Visualizing Housing Market Trends: An Analysis of Sale Prices and Features using Tableau

CHAPTER – 01

INTRODUCTION

1.1 – Project Overview

An Analysis of Sale Prices and Features Using Tableau

The housing market is really complicated. It is influenced by lots of things like how big a house's where it is located how many bedrooms and bathrooms it has how big the yard is and what kind of shape the house is in. If we can figure out how these things affect the price of a house it can help people who are buying or selling a house real estate agents and investors make decisions.

This project uses Tableau to look at housing market data and make sense of it. We use Tableau to make pictures and graphs that show us what is going on in the housing market. We can see how prices are changing what features of a house are most important and what is happening in the market. With Tableau we can make pictures and graphs that let users explore the data and learn new things.

We look at things like how sale prices spread out how the features of a house affect its price, which neighbourhoods are the most expensive and what is happening in the market that affects how much a house is worth. Tableau is really good at helping us make sense of the data so people who are interested can use it to learn things quickly and easily. We use Tableau to analyse housing market data and visualize the results, which helps us understand the housing market and make decisions, about houses.
