

CHAPTER – II

IDEATION PHASE

1.2 – Purpose of the Project

The Problem

People who buy and sell houses and real estate agents have a time figuring out what a house is worth and what will happen in the market. This is because housing data is over the place and it is hard to understand how all of the different factors affect the price of a house.

The usual reports that people use do not show how all of factors work together to affect the price of a house. Without a tool to help us understand all of this people have to rely on their intuition. They look at old data. This means that it takes a time to sell a house buyers do not have much power to negotiate and everyone loses money.

What We Will Look At:

Where a house is located: We will look at the neighbourhood. How close a house is to things like parks and stores.

What makes a house special: We will look at how big a house's how old it is and if it has been renovated. We will use graphs to show how the value of a house changes over time.

How different features affect the price: We will look at things, like how bedrooms and bathrooms a house has, if it has a garage and how big the yard is. We will use charts to show how each of these features affects the price of a house.
