

Visualizing Housing Market Trends: An Analysis of Sale Prices and Features using Tableau

9.2 – Disadvantages

1. Dependence on Data Quality

The accuracy of the insights that the Tableau dashboards give us depends on the housing dataset being quality. If the data is incomplete or old or just plain wrong it can lead to us seeing trends that're not really there and making decisions that are not accurate.

2. Limited Predictive Analysis

Tableau is really good at looking at the data we have and finding patterns. It can show us what happened in the past and how things are related. It is not so good at predicting what will happen in the future. To do that we need to use tools that can do machine learning.

3. Data Privacy and Security Concerns

The housing dataset has information about properties and transactions that people do not want everyone to know. If we do not handle the data carefully. If we share it with the wrong people or if we do not control who can see the dashboards it can cause big problems with privacy and security.

4. Performance Issues with Large Datasets

When we are working with big housing datasets that have millions of records the Tableau dashboards can be slow to load and not very responsive. This is especially true when we are using visualizations and filters.

5. Dependency on Tableau Software

To make or use the dashboards people need to have access to Tableau Desktop or Tableau Server or Tableau Public. This means we have to rely on Tableau and it can cost money to get all the features we need.

6. Real-Time Data Processing

The analysis we do is usually based on the data we have and it may not always show what is happening in the market right now. The only way to get real-time data is if the dashboard is connected to a data source that is always being updated.

7. Requirement of Technical Knowledge

To make dashboards that're really useful people need to know about getting the data ready designing the visualizations and how to use Tableau. People who do not know much about technology may have a time making or customizing advanced dashboards.

8. Interpretation Challenges

Even though the visualizations make the data easier to understand people can still get the idea about what the charts mean if they do not know much about real estate and data analysis.
