

Visualizing Housing Market Trends: An Analysis of Sale Prices and Features using Tableau

CHAPTER – X

CONCLUSION

10.1 – Conclusion

The **Visualizing Housing Market Trends project** is really good at showing how data can be used to look at housing market patterns and find out what makes property prices go up or down. It uses Tableau to make dashboards and charts that are easy to understand. This way complicated housing data becomes simple and clear.

This project lets people look at how sale prices connected to things like how big a property is, how many bedrooms and bathrooms it has, where it is and if it has been renovated. By cleaning up the data looking at it and using visualization techniques we can find big trends and patterns. This helps people understand what is going on in the market and what makes properties special.

The dashboards are interactive so people can use filters. Tooltips to get more information. We can also compare things, which makes the analysis more flexible and easier to use. Tableau stories help us tell the story of what we found out so people can easily understand the results and make decisions.

Overall, this project shows how important it is to use data to make decisions when it comes to estate. It gives us an easy-to-understand look at housing market trends. The system we built using Tableau is a way to analyze big sets of housing data. It can help buyers, sellers, investors and real estate professionals understand the market and figure out how much properties are worth.

We can make this project better by adding real-time housing market data, advanced analytics and machine learning models. This will help us predict what property prices will be in the future and what new trends are coming up in the market. The Visualizing Housing Market Trends project and Tableau can really help people who're interested, in Housing Market Trends and want to learn more about it.
